

Met-Ocean data sets: climate, reanalysis, forecast and in situ data

Alfredo Izquierdo (Universidad de Cádiz- INMAR)

alfredo.izquierdo@uca.es

Contents

- Met-Ocean data types and characteristics
- Analysis, reanalysis and climatology
- Overview of some data sets
- Some CMEMS products description (PHYS and INSITU)
- Data lexicon: quality information and product user manual

Metocean data

Meteorology and ocean physics data. Part of the Earth System data.

Ocean observing system report card 2021

At present a quite complete observing system (in situ and remote).

Not evenly distributed obs, fewer back in time.

We need a long and reliable record for:

- ✓ Climate change
- ✓ Ocean health
- ✓ Forecast and warning

Metocean data types (products)

Re/analysis products

An **analysis** is a snapshot of the **state of the ocean** at any **given time**. It is done using a **model, data and observations** to provide a best fit produced **on the fly**.

An oceanographic **reanalysis** consists in modelling **the state of the ocean over a long period of time** (several years) while correcting it with the **best available past observations**.

From the Blue Book Copernicus for a Sustainable Ocean

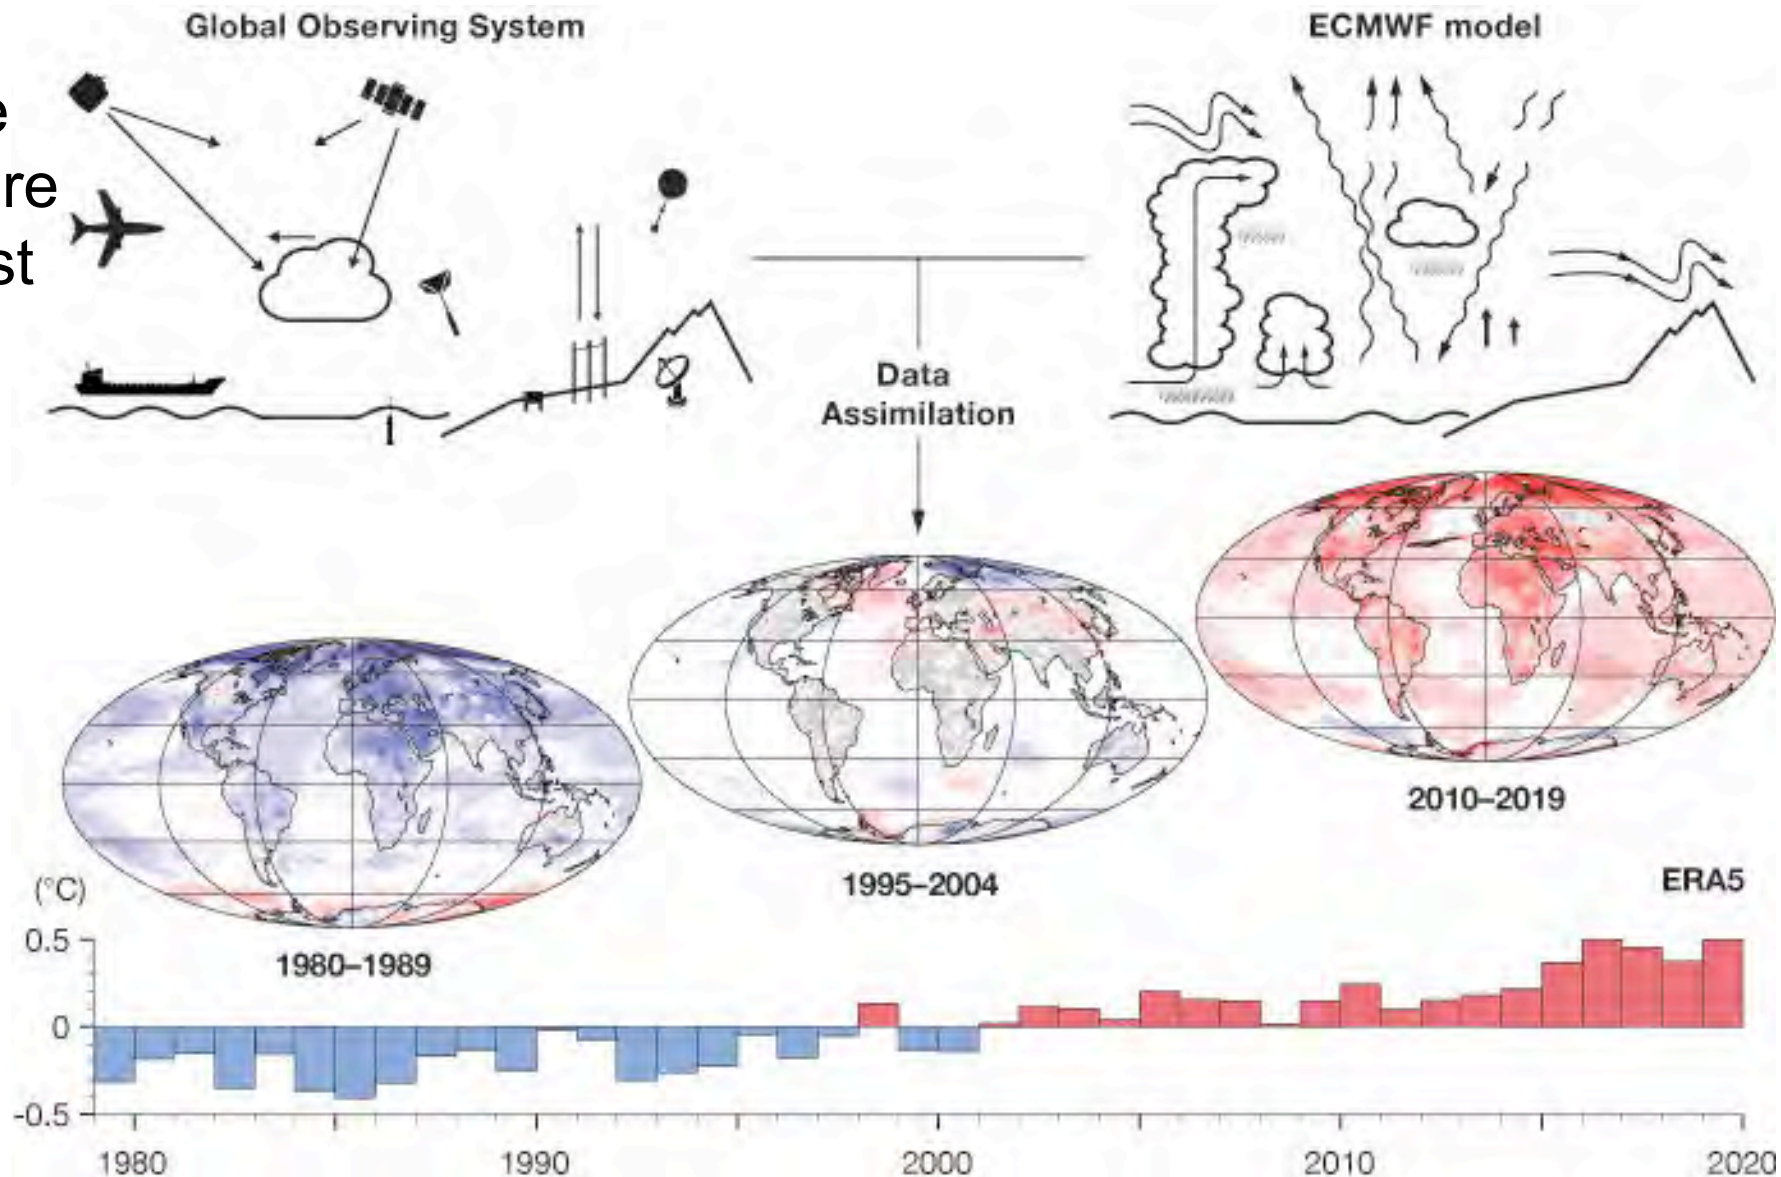

From E. Kalnay, www2.atmos.umd.edu

Re/analysis data

Reanalysis data provide the most complete picture currently possible of past weather and climate.

‘Maps without gaps’.

<https://www.ecmwf.int/en/about/media-centre/focus/2020/fact-sheet-reanalysis>

Re/analysis data: uncertainty

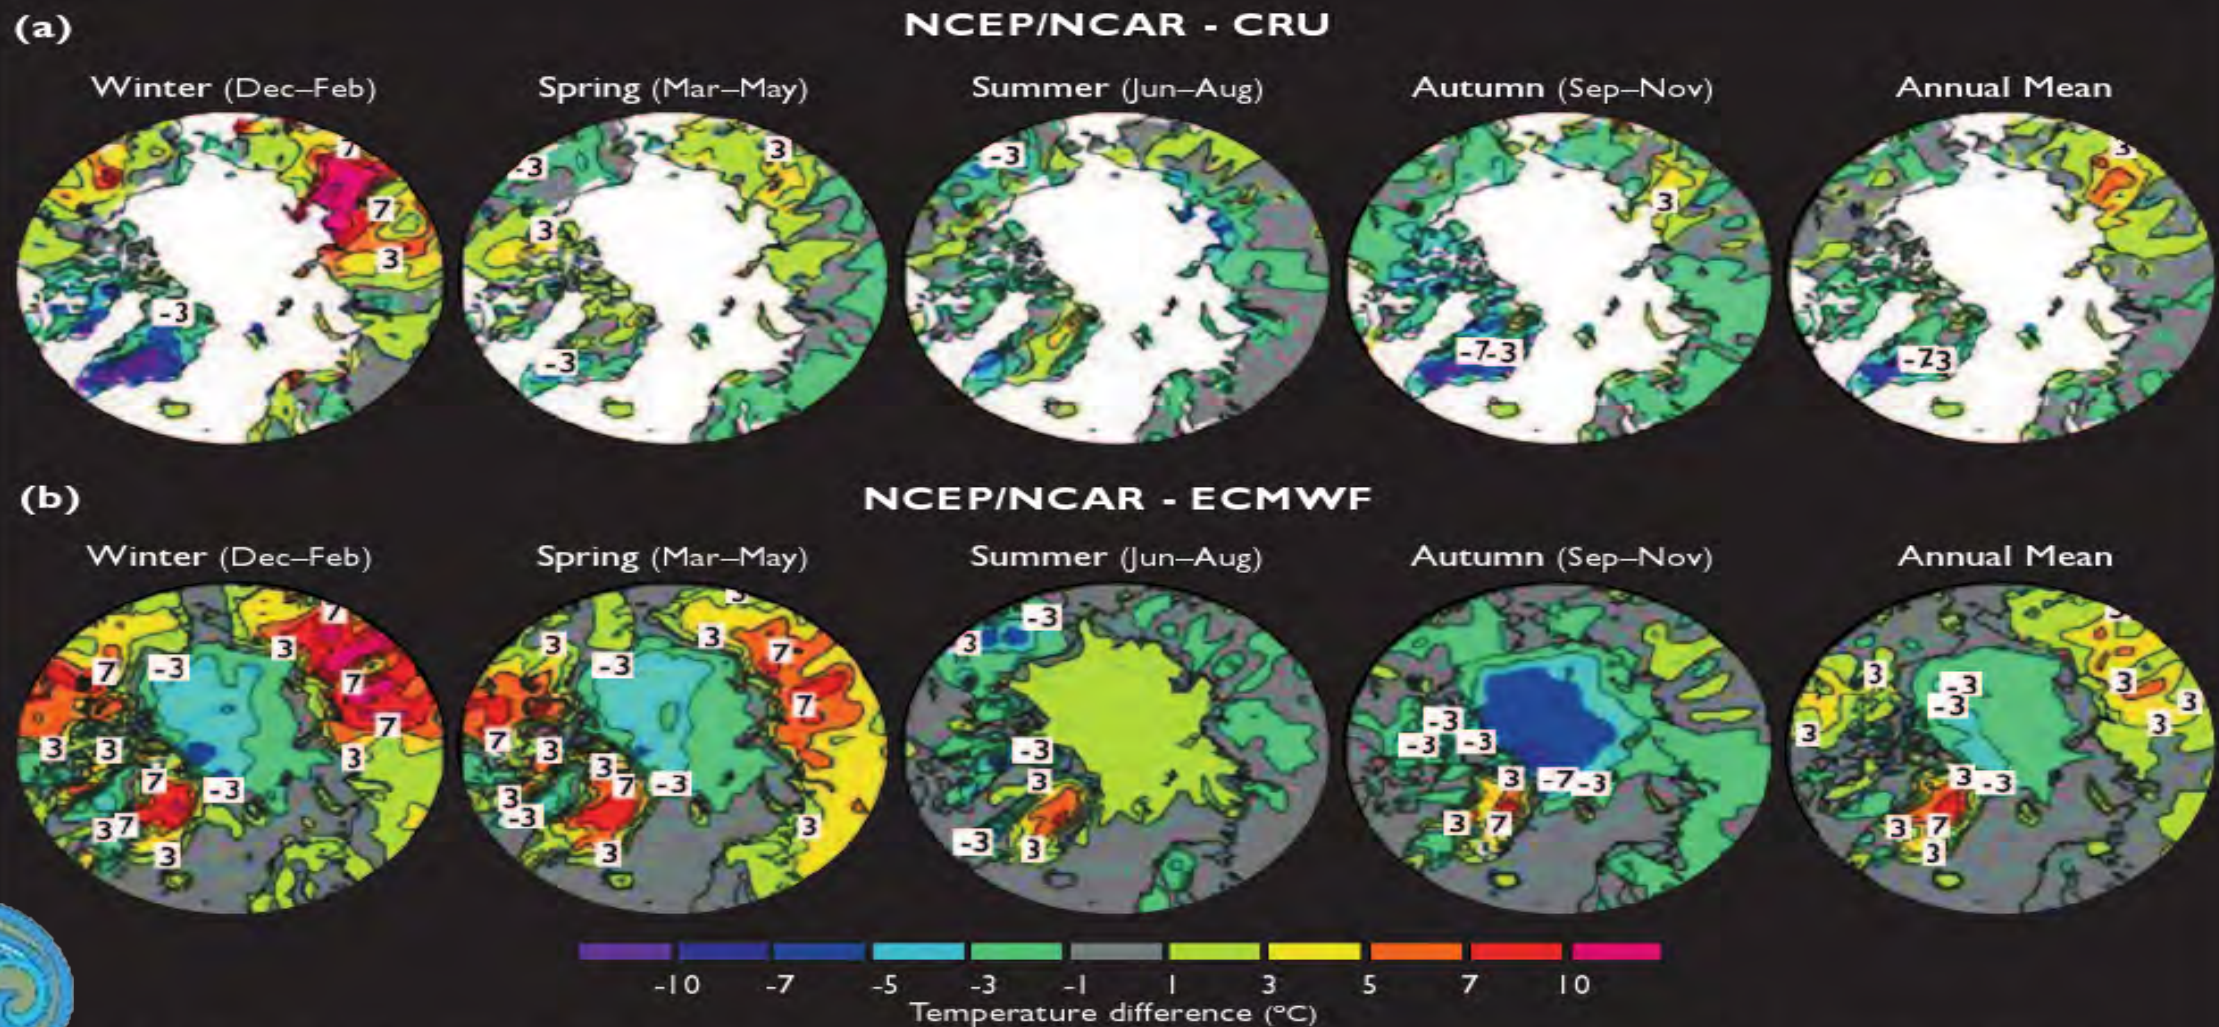

Fig. 4.2. Seasonal and annual mean differences in surface air temperature (a) between the NCEP/NCAR reanalysis and the CRU dataset for the period 1961 to 1990 and (b) between the NCEP/NCAR and the ECMWF reanalyses for the period 1979 to 1993.

Re/analysis data: uncertainty

Physical Sciences Laboratory

Ocean: Web-based Reanalysis Intercomparison Tool: Monthly Maps

Please email us or post comments to the Reanalysis.org web page with any issues, suggestions or comments. The latest updates and issues for the page are available.

Plot monthly maps or vertical cross-sections from different reanalysis datasets as well as differences between reanalyses. Means, anomalies and climatology.

Dataset 1: NOAA GODAS Dataset 2: UNID SODA3-ERA4

Variable: Potential Temperature

Enter years for composites (from 1 to 20): the LAST month.

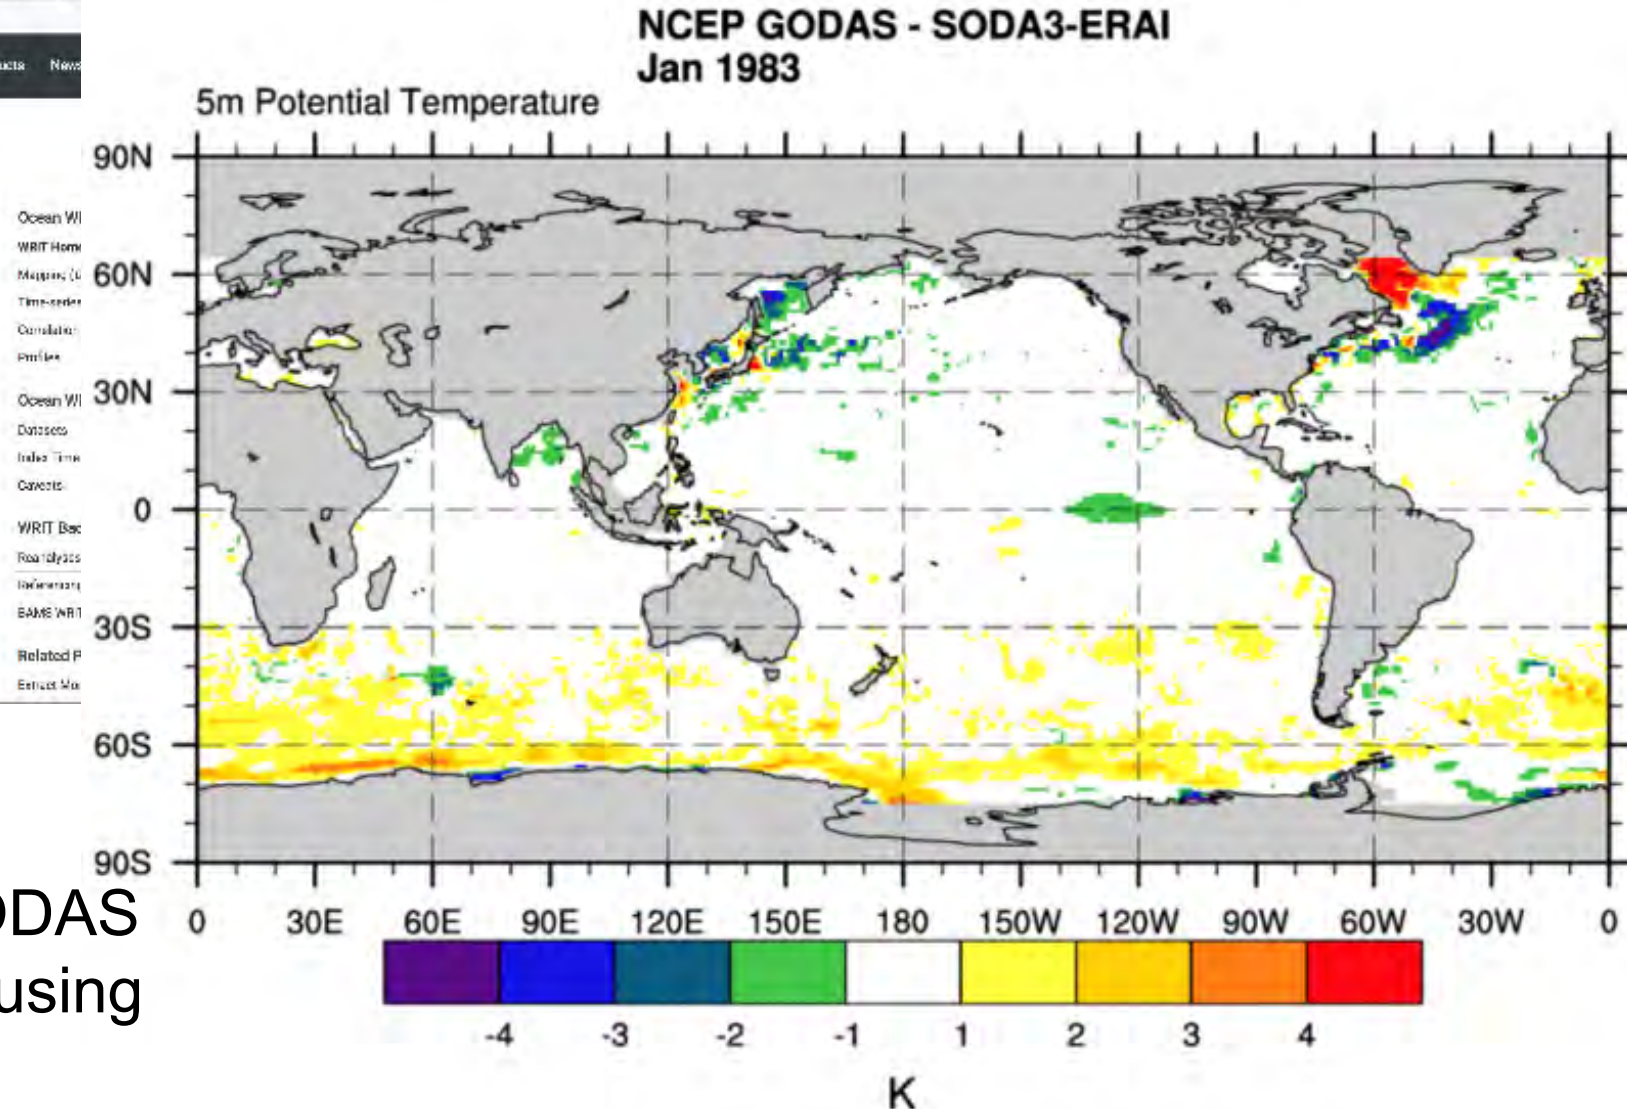

Enter year range (limit 50 years). Year should correspond to last month of season. DJF 1982-83 entered as 1983 to 1983.

First Year of range to last year of range: 2001

Enter years for Dataset 2 if a different set of dates from Dataset 1 (from 1 to 20): e.g. 1972. For seasons that span a year (e.g. DJF), please enter year of the LAST month.

Differences between GODAS and SODA3 using NOAA WRIT

Climatology data

Climate is the statistical ensemble of states occurring in the system Atmosphere-Ocean-Solid Earth in a period of several decades (Monin, 1979).

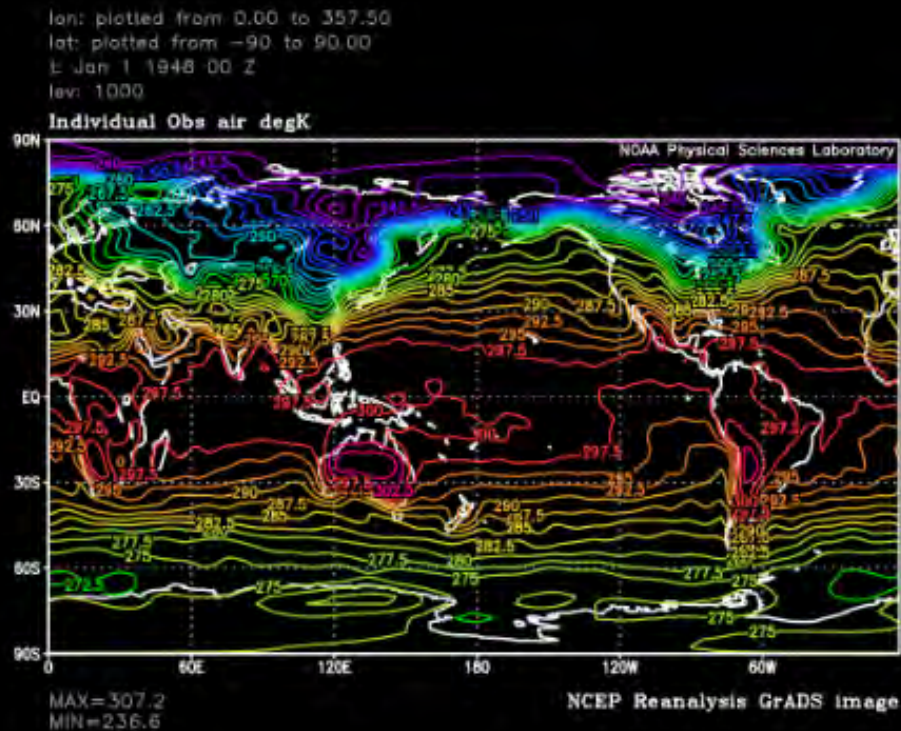

Climate may be defined as the multivariate, multiple-time probability distribution of status of the ocean-ice-atmosphere system (North et al. 1982).

Climate normals: Period averages computed for a uniform and relatively long period comprising at least three consecutive ten-year periods (WMO No-1203).

Climate includes arithmetic **mean**, but it can also include values such as the **standard deviation**, percentile points, number of exceedances of a threshold or **extreme values**.

NCEP Reanalysis GrADS image

We have separated the data documentation into seven sections:

- Pressure level
- Surface
- Surface Fluxes
- Other Fluxes
- Tropopause
- Derived Data
- Spectral Coefficients

Usage Restrictions:

- None

Detailed Description:

- The NCEP/NCAR Reanalysis 1 project is using a state-of-the-art analysis/forecast system to perform data assimilation using past data from 1948 to the present. A large subset of this data is available from PSL in its original 4 times daily format and as daily averages. However, the data from 1948-1957 is a little different, in the regular (non-Gaussian) gridded data. That data was done at 8 times daily in the model, because the inputs

World Ocean Atlas 2009 (WOA09)

[www.nodc.noaa.gov/OC5/](http://www.nodc.noaa.gov/OC5/WOA09/pr_woa09.html)
WOA09/pr_woa09.html

World Ocean Atlas 2009 (WOA09) is a set of **objectively analyzed (1° grid)** climatological fields of **in situ temperature, salinity, dissolved oxygen, Apparent Oxygen Utilization (AOU), percent oxygen saturation, phosphate, silicate, and nitrate at standard depth levels for annual, seasonal, and monthly compositing periods** for the World Ocean. It also includes **associated statistical fields** of observed oceanographic profile data interpolated to standard depth levels on both 1° and 5° grids .

WORLD OCEAN ATLAS 2018 (WOA18)

The *WOA18* updates previous versions of the World Ocean Atlas to include approximately 3 million new oceanographic casts added to the World Ocean Database and renewed quality control.

This final version of WOA18 published in July, 2019 is replacing a prereleased version made available in September, 2018. The changes between the versions include:

1. For the first time the Animal mounted pinniped temperature profiles (APB) have been added improving coverage in high latitude areas.
2. A different Expendable Bathythermograph (XBT) correction (Cheng et al., 2014) has been employed.
3. A double XBT correction has been detected in pre-release version and fixed in final version.
4. All temperature and salinity climatological fields were re-calculated to account for these adjustments.

World Ocean Atlas 2018 (WOA18)

Overview

Short description:

The Operational Mercator global ocean analysis and forecast system at 1/12 degree is providing 10 days of 3D global ocean forecasts updated daily. The time series start on January 1st, 2016 and is aggregated in time in order to reach a two full year's time series sliding window.

This product includes daily and monthly mean files of temperature, salinity, currents, sea level, mixed layer depth and ice parameters from the top to the bottom over the global ocean. It also includes hourly mean surface fields for sea level height, temperature and currents. The global ocean output files are displayed with a 1/12 degree horizontal resolution with regular longitude/latitude equirectangular projection.

50 vertical levels are ranging from 0 to 5500 meters.

This product also delivers a special dataset for surface current which also includes wave and tidal drift called SMOC (Surface merged Ocean Current).

CHANGE RECORD

Issue	Date	§	Description of Change	Author	Validated By
1.0	23/09/2016	All	Creation of the document for CMEMS V2.3	M. Drevillon	Y. Drillet
2.0	19/10/2016		Correction after review	J. M. Lellouche	Y. Drillet
2.1	01/01/2019	SI,	Merging of the document to include SMOC dataset	S. Law Chune	Mercator Ocean

1.2 Executive summary

The quality of the Global high resolution system and GLO_HR products has been assessed using one year of the hindcast. The headline results for each of the variables assessed are as follows.

1.2.1 Temperature and salinity

The systems description of the ocean water masses is very accurate on average and departures from in situ observations rarely exceed 0.5 K and 0.1 psu. In the thermocline, RMS errors reach 1 K and 0.2 psu. In high variability regions like the Gulf Stream or the Agulhas Current, or the Eastern Tropical Pacific, RMS errors reach more than 2 K and 0.5 psu locally.

CONSTANTLY UPDATED: ASSESSMENT LEADS TO PRODUCT IMPROVEMENT

QUALITY INFORMATION DOCUMENT (QUID)

variable	Region	Type of metric	MERSEA/GODAE classification	Reference observational dataset
3D temperature	Global, and regional basins	Residual Error=obs-model Time evolution of RMS error on 0-500m Vertical profile of mean error.	CLASS4	CMEMS: CORIOLIS T (z) profiles
3D salinity	Global, and regional basins	Residual Error=obs-model Time evolution of RMS error on 0-500m Vertical profile of mean error.	CLASS4	CMEMS: CORIOLIS S(z) profiles
Sea level anomaly (SLA)	Global, and regional basins	Residual Error=obs-model Time evolution of RMS and mean residual error	Data assimilation statistics	CMEMS: On track AVISO sla observations from Jason3, Saral Altiika and Cryosat
Sea surface height	At tide gauges (Global but near coastal regions)	Residual Error=model-obs Time series correlation and RMS error	CLASS4	Tide gauges sea level time series from GLOSS, BODC, Imedea, WOCE, OPPE and SONEL
Sea Surface Temperature SST	Global, and regional basins	Residual Error=obs-model Time evolution of RMS and mean error	Data assimilation statistics	CMEMS: OSTIA SST

a) TEMP mean OBS-MODEL 0-5 m 2015

b) TEMP RMS OBS-MODEL 0-5 m 2015

c) TEMP mean OBS-MODEL 5-100 m 2015

d) TEMP RMS OBS-MODEL 5-100 m 2015

e) TEMP mean OBS-MODEL 100-300 m 2015

f) TEMP RMS OBS-MODEL 100-300 m 2015

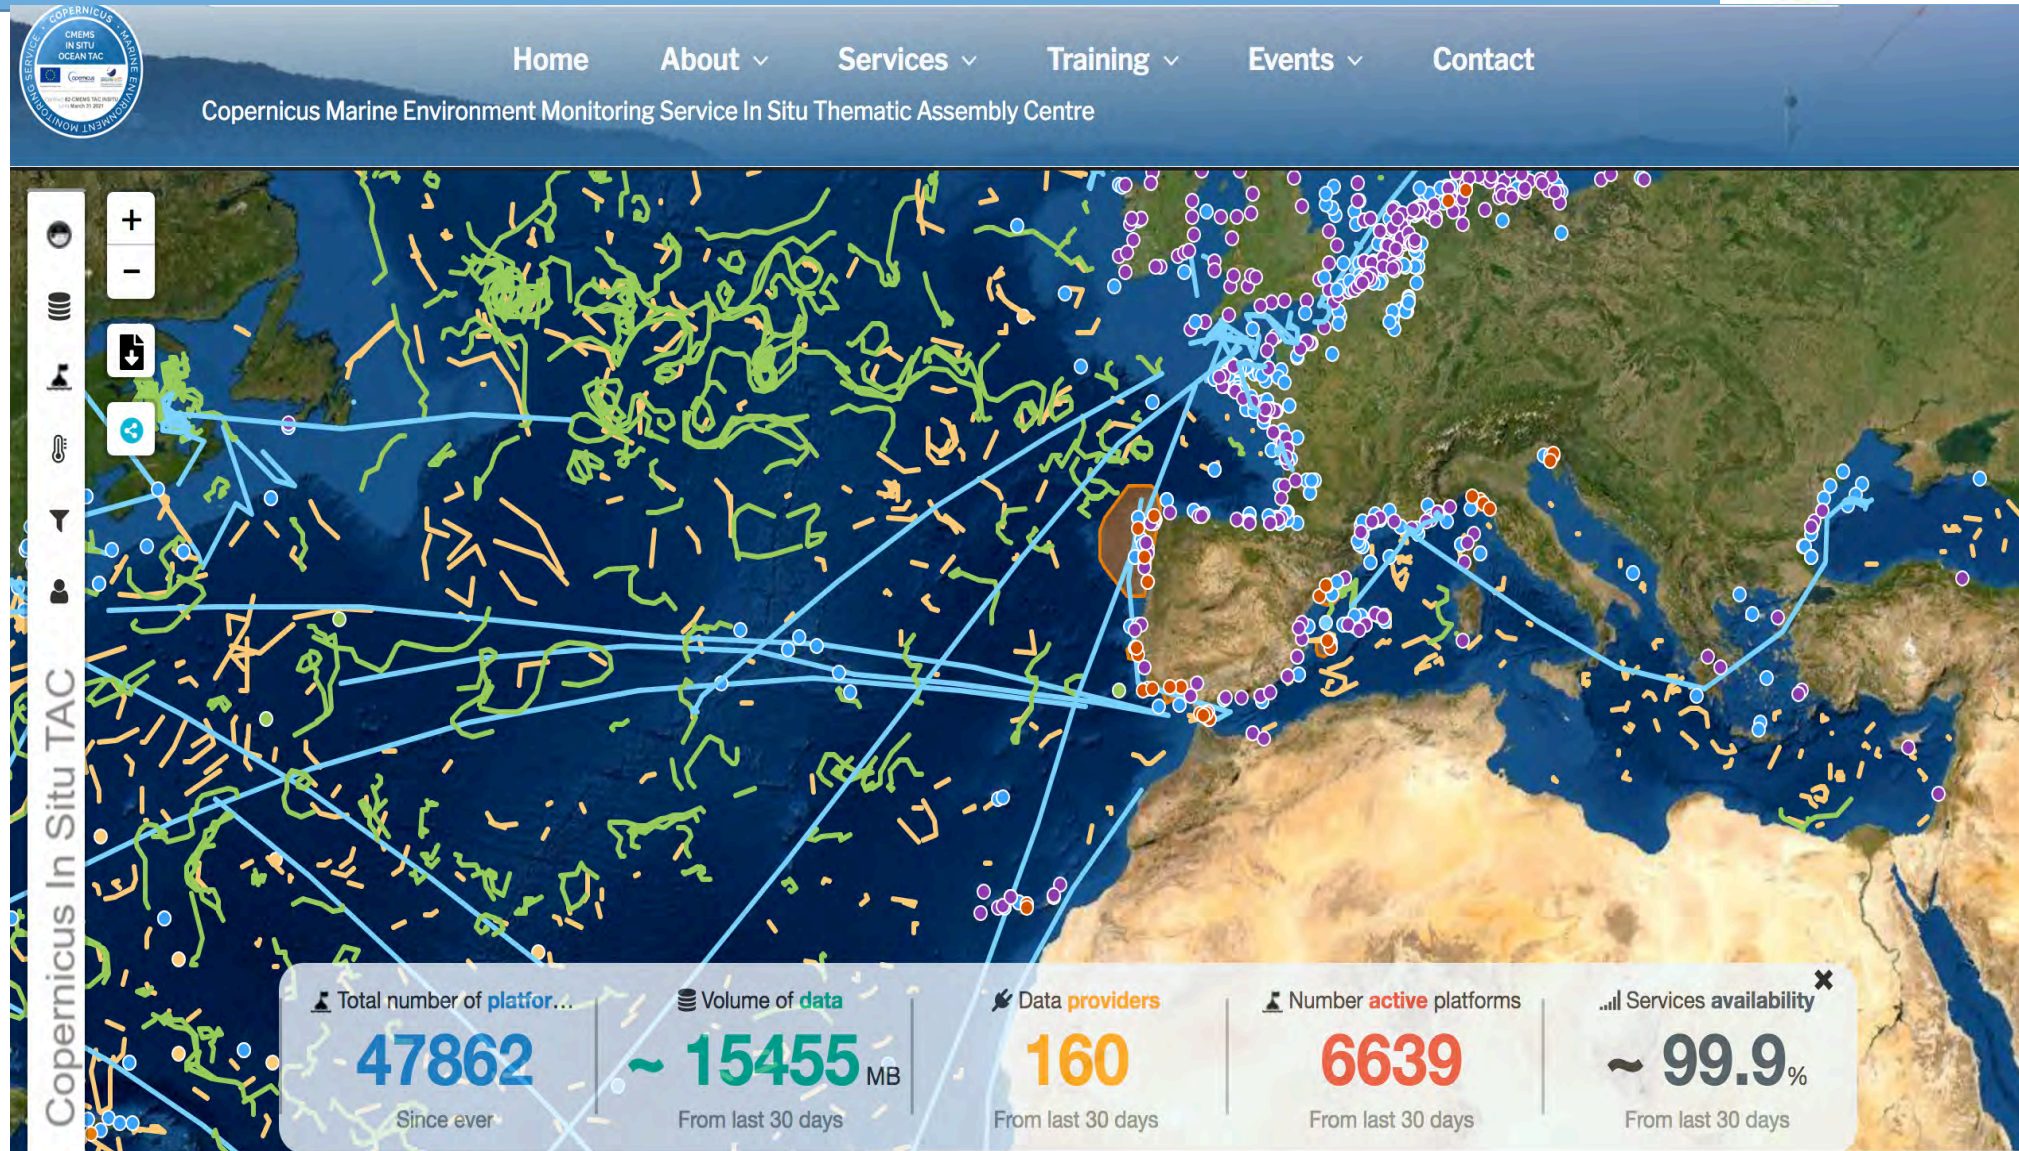

Assessment metrics for different variables, using a large set of observations and reference climatologies

Each regional center:

- Data acquisition
- Automated Quality Control
- Product validation
- Product distribution

QUALITY CONTROL: 2 STEPS

STEP 1: Automated NRTQC

Code	Meaning	Comment
0	No QC was performed	-
1	Good data	All real-time QC tests passed.
2	Probably good data	These data should be used with caution
3	Bad data that are potentially correctable	These data are not to be used without scientific correction.
4	Bad data	Data have failed one or more of the tests.
5	Value changed	Data may be recovered after transmission error.
6	Value below detection/quantification	The level of the measured phenomenon was too small to be quantified/detected by the technique employed to measure it. The accompanying value is the quantification/detection limit for the technique or zero if that value is unknown
7	Nominal value	-
8	Interpolated value	Missing data may be interpolated from neighbouring data in space or time.
9	Missing value	-

Table 4 Quality control flags.

STEP 2: REP: Area dependent metrics, including

1. Visual quality control.
2. Comparison to a reference climatology.
3. Objective analysis and residual analysis.
4. Assessment of drifter data.
